EJ Demographic Index in
San Joaquin County (2023)

Mapping summary:

In San Joaquin County, unsafe water quality poses a major public health threat, particularly for communities identified by EJScreen's demographic indicators. Water contamination and toxicity have been linked to agricultural and industrial activity, but the full scope of exposure is difficult to measure because much of the available data does not account for people who travel through, recreate in, or work near contaminated water.

The map on the left (Wastewater Discharge in San Joaquin County, 2023) shows wastewater discharge from permitted facilities, measured as toxicity-weighted concentration divided by distance in meters. The map on the right (EJ Demographic Index in San Joaquin County, 2023) shows a demographic index based on percent low-income and percent people of color. In the western part of the county, areas with high wastewater toxicity substantially overlap with areas scoring high on the demographic index.

Include a brief revision memo (one short paragraph) identifying which specifications were not met and explaining the changes you made:

I was advised to make changes to my maps to make them more legible. I increased the size of the title and the legends.
